no mechanism added: 5.3 ± 0.1
editor silencing, 30-day half-life
editor silencing, 50-day half-life
per-monomer efficiency, 6-monomer half-life
transit-amplifying progenitors, 80% of daughters, 2 rounds
transit-amplifying progenitors, 50% of daughters, 3 rounds
transit-amplifying progenitors, 30% of daughters, 2 rounds
transit-amplifying progenitors, 50% of daughters, 2 rounds
gliogenesis, switching on at day 120
persistent progenitor compartment, 20% of founders
gliogenesis, switching on at day 100
gliogenesis, switching on at day 80
writing without division, adult-cortex rate
death of neurons, 0.010 per day
writing without division, 0.02 per day
no gradient
all 8 resolvable arms survive
Holm correction over 14 comparisons
(largest adjusted p = 3e-02)
blunts the window
not resolvable at fifty populations
deepens the window
range this arm could not resolve
